Task 1: AI Website Copy Generator for Local Businesses

Future Interns — Prompt Engineering Track

Prepared By: Manish

Business Chosen: Manish Gentora Cafe, Erode

AI Tool Used: Claude AI

Repository: FUTURE_PE_01

Date: July 4, 2026

1. Objective

The objective of this task was to design and generate a complete, conversion-focused website copy package for a local business using AI-based prompt engineering. The deliverable included homepage copy, a services page, and call-to-action (CTA) sections, all created through structured prompts submitted to Claude AI. This task builds practical skills in prompt design, website copywriting, and understanding how AI tools can be applied to real-world client work.

2. Business Overview

The business selected for this task is Manish Gentora, a cafe located in Erode. As a neighborhood cafe, the business needed website copy that reflects a warm, welcoming tone while remaining professional enough to build trust with new visitors. The target audience includes local residents looking for a comfortable place to relax, work, or meet friends, as well as individuals and businesses interested in event catering or private space bookings.

Key positioning goals for the copy were to:

- Establish an inviting, community-oriented brand voice
- Clearly communicate the range of services offered
- Encourage visitors to take action (visit, book, or inquire)

3. Prompt Strategy

The prompting approach was broken into three distinct sections, each targeting a specific part of the website. This modular strategy made it easier to control tone, length, and content focus for each section rather than generating everything in a single, harder-to-control prompt.

3.1 Structure Used

- Homepage Prompt — focused on headline, value proposition, and a 'why choose us' section
- Services Prompt — focused on listing 3-4 services with benefit-driven descriptions
- CTA Prompt — focused on three short, action-driven prompts for Contact, Booking, and Quote requests

3.2 Prompting Principles Applied

- Explicitly naming the business and location to ground outputs in real context
- Specifying tone ('warm and professional') to keep voice consistent across sections
- Requesting specific structural elements (headline, 2-3 sentence proposition) to control output length
- Asking for persuasive but simple language to keep copy website-ready without further editing

4. Prompt Iterations

The prompts used for this task were refined to be direct and specific from the first attempt, since clear constraints (tone, structure, length) were built in upfront. This reduced the need for multiple rounds of revision. The final prompts used were:

4.1 Homepage Prompt

"Write homepage website copy for 'Manish Gentora', a cafe in Erode. Include: a headline, a short value proposition (2-3 sentences), and a brief 'why choose us' section. Keep tone warm and professional, and make it persuasive but simple."

4.2 Services Prompt

"Write a services page for Manish Gentora. List 3-4 services they offer, each with a short 2-3 sentence description that highlights the benefit to the customer."

4.3 CTA Prompt

"Write 3 short call-to-action sections for Manish Gentora's website: one for 'Contact Us', one for 'Book Now', and one for 'Get a Free Quote/Consultation'. Each should be 1-2 sentences, action-driven."

5. AI Outputs

5.1 Homepage Copy

Headline: "Where Every Cup Tells a Story"

The value proposition positioned Manish Gentora as a neighborhood retreat built around genuine hospitality, while the "why choose us" section highlighted four pillars: handcrafted drinks, fresh food, a comfortable environment, and community involvement.

5.2 Services Page

The AI generated four clearly defined services: Dine-In Experience, Takeaway & Grab-and-Go, Catering for Events, and Private Space Bookings — each with a short, benefit-focused description suited to a general cafe audience.

5.3 CTA Sections

Three CTAs were generated for Contact Us, Book Now, and Get a Free Quote, each kept to one or two sentences with a clear action orientation.

Full prompt and output text is documented in the prompts/ and outputs/ folders of this repository.

6. Challenges

- Keeping tone consistent across three separately generated sections required repeating tone instructions in each prompt rather than relying on the AI to infer it from context.
- Avoiding generic, one-size-fits-all cafe copy meant adding location and community-specific details to make the content feel authentic rather than templated.
- Balancing persuasive language with simplicity, since overly promotional copy can feel inauthentic for a small local business.

7. Learnings

- Structuring prompts around a clear audience (a local cafe in a specific city) produces more specific and usable copy than generic prompts.
- Explicitly specifying tone and structure in the prompt reduces the need for revision and keeps outputs consistent.
- Breaking a website copy task into smaller, section-specific prompts gives more control over length and focus than requesting everything at once.
- AI-generated copy works best as a strong first draft — light human review still helps ensure the brand voice feels authentic.

8. Conclusion

This task demonstrated how structured prompt engineering can be used to generate professional, conversion-focused website copy for a real-world local business use case. By breaking the deliverable into homepage, services, and CTA components and applying consistent tone and structural instructions, the AI-generated output required minimal editing to be considered website-ready. This exercise strengthened practical skills in prompt design, copywriting, and AI-assisted content workflows applicable to future client projects.
